The Problem

NO PERSONALIZATION

Existing games offer no real customization. Players are stuck in worlds they didn't create, following paths they didn't choose.

TOO RIGID & LINEAR

Interactive fiction locks you into a single track. No room for branching choices or real creative agency.

NO STRUCTURE

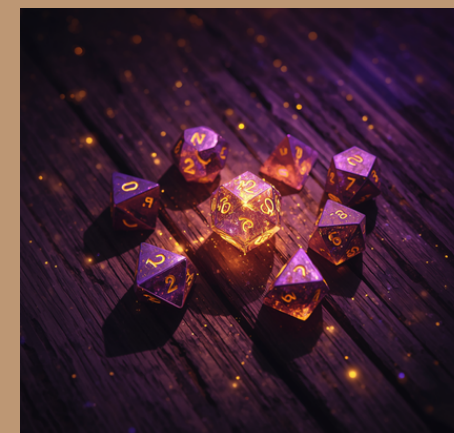

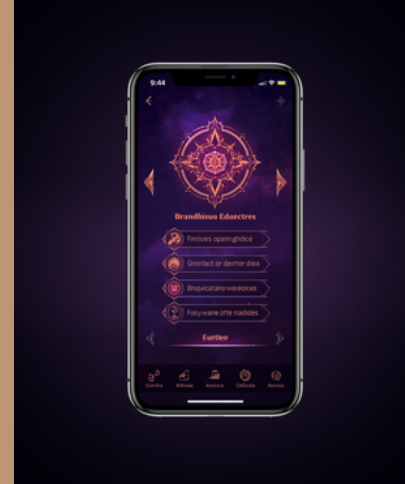

Tabletop RPGs need a group and a DM. Solo, on-demand storytelling has no home that actually works.

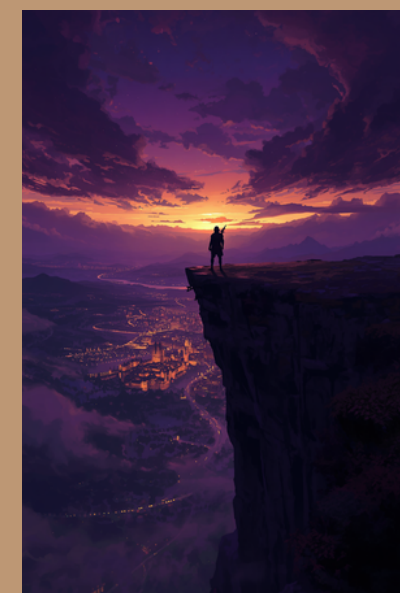

Questie: How it works

1. The player selects a genre, setting, character class, tone, and difficulty.
2. Questie sends these choices to the Groq AI API, which generates the opening story, objective, characters, inventory, and suggested actions.
3. The player can choose a suggested action or enter a custom response.
4. The application tracks the player's health, inventory, location, decisions, and story progress to generate a consistent outcome.
